

THE IRON FUEL LANDSCAPE

For a livable future, we must cut our CO₂ emissions drastically. Looking forward, SOLID and its partners introduce a revolutionary solution, advocating iron as a fuel. Iron fuel is circular, compact CO₂-free and cost effective. Besides that, it is easy to store, scalable and safe, making it a green solution for the energy transition.

Iron fuel can be used to supply the industry with a sustainable heat source, with the use of the iron combustion technology. Besides that, iron can be used to store and transport hydrogen.

The possibilities are endless and we are working hard to expand the landscape even further.
